DESCRIPTION

The LVQ138 is a low voltage CMOS 3 TO 8 LINE DECODER (INVERTING) fabricated with sub-micron silicon gate and double-layer metal wiring C^2MOS technology.

It is ideal for low power and low noise 3.3V applications.

If the device is enabled, 3 binary select inputs (A, B and C) determine which one of the outputs will go low. If enable input G1 is held low or either $\overline{G2A}$ or $\overline{G2B}$ is held high, the decoding function is inhibited and all the 8 outputs go high.

Three enable inputs are provided to ease cascade connection and application of address decoders for memory systems.

It has better speed performance at 3.3V than 5V LSTTL family combinad with the true CMOS low power consumption.

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.
