

11-Bit, 125-MSPS Analog-To-Digital Converter

FEATURES

- 11-bit Resolution
- 125-MSPS Sample Rate
- High SNR: 66.3 dBFS at 100 MHz f_{IN}
- High SFDR: 81 dBc at 100 MHz f_{IN}
- 2.3-V_{PP} Differential Input Voltage
- Internal Voltage Reference
- 3.3-V Single-Supply Voltage
- Analog Power Dissipation: 578 mW
- Serial Programming Interface
- TQFP-64 PowerPAD™ Package
- Pin-Compatible With:
 - ADS5500 (14-Bit, 125 MSPS)
 - ADS5541 (14-Bit, 105 MSPS)
 - ADS5542 (14-Bit, 80 MSPS)
 - ADS5520 (12-Bit, 125 MSPS)
 - ADS5521 (12-Bit, 105 MSPS)
 - ADS5522 (12-Bit, 80 MSPS)

- Recommended Operational Amplifiers:
THS3201, THS3202, THS4503, THS4509,
THS9001, OPA695, OPA847

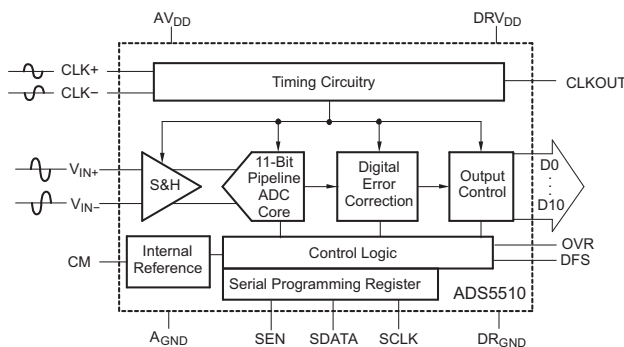

APPLICATIONS

- Wireless Communication
 - Communication Receivers
 - Base Station Infrastructure
- Test and Measurement Instrumentation
- Single and Multichannel Digital Receivers
- Communication Instrumentation
 - Radar
 - Infrared
- Video and Imaging
- Medical Equipment

DESCRIPTION

The ADS5510 is a high-performance, 11 bit, 125 MSPS analog-to-digital converter (ADC). To provide a complete converter solution, it includes a high-bandwidth linear sample-and-hold stage (S&H) and internal reference. Designed for applications demanding the highest speed and highest dynamic performance in little space, the ADS5510 has excellent power consumption of 578 mW at 3.3-V single-supply voltage. This allows an even higher system integration density. The provided internal reference simplifies system design requirements. Parallel CMOS-compatible output ensures seamless interfacing with common logic.

The ADS5510 is available in 64-pin TQFP PowerPAD package over the industrial temperature range.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Instruments.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION⁽¹⁾

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
ADS5510	HTQFP-64 ⁽²⁾ PowerPAD	PAP	-40°C to 85°C	ADS5510I	ADS5510IPAP	Tray, 160
					ADS5510IPAPR	Tape and Reel, 1000

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI Web site at www.ti.com.
- (2) Thermal pad size: 3,5 mm x 3,5 mm (min), 4 mm x 4 mm (max). $\theta_{JA} = 21.47^{\circ}\text{C/W}$ and $\theta_{JC} = 2.99^{\circ}\text{C/W}$, when used with 2 oz. copper trace and pad soldered directly to a JEDEC standard, four-layer, 3 in x 3 in PCB.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

				UNIT
V _{SS}	Supply Voltage	AV _{DD} to A _{GND} , DRV _{DD} to DR _{GND}	-0.3 to 3.7	V
		A _{GND} to DR _{GND}	±0.1	V
	Analog input to A _{GND} ⁽²⁾⁽³⁾		-0.3 to minimum (AV _{DD} + 0.3, 3.6)	V
	Logic input to DR _{GND}		-0.3 to DRV _{DD}	V
	Digital data output to DR _{GND}		-0.3 to DRV _{DD}	V
	Operating temperature range		-40 to 85	°C
T _J	Junction temperature		105	°C
T _{stg}	Storage temperature range		-65 to 150	°C

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) If the input signal can exceed 3.6 V, then a resistor greater than or equal to 25 Ω should be added in series with each of the analog input pins to support input voltages up to 3.8 V. For input voltages above 3.8 V, the device can only handle transients and the duty cycle of the overshoot should be limited to less than 5% for inputs up to 3.9 V.
- (3) The overshoot duty cycle can be defined as the ratio of the total time of overshoot to the total intended device lifetime, expressed as a percentage. The total time of overshoot is the integrated time of all overshoot occurrences over the lifetime of the device.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	MIN	TYP	MAX	UNIT
Supplies				
AV _{DD} Analog supply voltage	3	3.3	3.6	V
DRV _{DD} Output driver supply voltage	3	3.3	3.6	V
Analog input				
Differential input range		2.3		V _{PP}
V _{CM} Input common-mode voltage ⁽¹⁾	1.45	1.55	1.65	V
Digital Output				
Maximum output load		10		pF
Clock Input				
ADCLK input sample rate (sine wave) 1/t _c	DLL ON	60	125	MSPS
	DLL OFF	2	80	
Clock amplitude, sine wave, differential	1	3		V _{PP}
Clock duty cycle		50%		
T _A Open free-air temperature range	-40		85	°C

- (1) Input common-mode should be connected to CM.

ELECTRICAL CHARACTERISTICS

Typical values given at $T_A = 25^\circ\text{C}$, min and max specified over the full recommended operating temperature range, $AV_{DD} = DRV_{DD} = 3.3\text{ V}$, sampling rate = 125 MSPS, 50% clock duty cycle, DLL On, 3- V_{PP} differential clock, and -1 dBFS differential input, unless otherwise noted

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT

t_f	Output clock fall time		1.5	1.7	ns
t_{PDI}	Input clock to output clock delay	4.2	4.8	5.5	ns
t_r	Data rise time		3.6	4.6	ns
t_f	Data fall time		2.8	3.7	ns
	Output enable(OE) to data output delay			1000	Clock cycles
	Wakeup time			1000	Clock cycles
				1000	
	Latency		17.5		Clock cycles

- (1) Timing parameters are ensured by design and characterization, and not tested in production.
- (2) See [Table 5](#) through [Table 8](#) in the *Application Information* section for timing information at additional sampling frequencies.
- (3) Data valid refers to 2 V for LOGIC HIGH and 0.8 V for LOGIC LOW.
- (4) See the *Output Information* section for details on using the input clock for data capture.
- (5) These specifications apply when the CLKOUT polarity is set to rising edge (according to [Table 2](#)). Add 1/2 clock period for the valid number for a falling edge CLKOUT polarity.
- (6) Data outputs are available within a clock from assertion of OE; however, it takes 1000 clock cycles to ensure stable timing with respect to input clock.

A. It is recommended that the loading at CLKOUT and all data lines are accurately matched to ensure that the above timing matches closely with the specified values.

Figure 1. Timing Diagram

RESET TIMING CHARACTERISTICS

Typical values given at $T_A = 25^\circ\text{C}$, min and max specified over the full recommended operating temperature range, $AV_{DD} = DRV_{DD} = 3.3\text{ V}$, and $3\text{-}V_{PP}$ differential clock, unless otherwise noted

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
Switching Specification					
t_1	Power-on delay			10	ms
t_2	Reset pulse width	2			μs
t_3	Register write delay	2			μs
	Power-up time		40		ms

Figure 2. Reset Timing Diagram

SERIAL PROGRAMMING INTERFACE CHARACTERISTICS

The ADS5510 has a three-wire serial interface. The ADS5510 latches serial data SDATA on the falling edge of serial clock SCLK when SEN is active.

- Serial shift of bits is enabled when SEN is low. SCLK shifts serial data at the falling edge.
- Minimum width of data stream for a valid loading is 16 clocks.
- Data is loaded at every 16th SCLK falling edge while SEN is low.
- In case the word length exceeds a multiple of 16 bits, the excess bits are ignored.
- Data can be loaded in multiples of 16-bit words within a single active SEN pulse.
- The first 4-bit nibble is the address of the register while the last 12 bits are the register contents.

Figure 3. DATA Communication is 2-Byte, MSB First

Figure 4. Serial Programming Interface Timing Diagram

Table 1. Serial Programming Interface Timing Characteristics

SYMBOL	PARAMETER	MIN ⁽¹⁾	TYP ⁽¹⁾	MAX ⁽¹⁾	UNIT
t _{SCLK}	SCLK period	50			ns
t _{WSCLK}	SCLK duty cycle	25%	50%	75%	
t _{SLOADS}	SEN to SCLK setup time	8			ns
t _{SLOADH}	SCLK to SEN hold time	6			ns
t _{DS}	Data setup time	8			ns
t _{DH}	Data hold time	6			ns

(1) Typ, min, and max values are characterized, but not production tested.

Table 2. Serial Register Table⁽¹⁾

A3	A2	A1	A0	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	DESCRIPTION
															DLL CTRL	Clock DLL
1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0	Internal DLL is on; recommended for 60 MSPS to 125 MSPS clock speeds.
1	1	0	1	0	0	0	0	0	0	0	0	0	0	1	0	Internal DLL is off; recommended for 2 MSPS to 80 MSPS clock speeds.
															Test Mode	
				TP<1>	TP<0>											
1	1	1	0	0	0	0	0	0	0	0	0	0	0	X	0	Normal mode of operation
1	1	1	0	0	0	1	0	0	0	0	0	0	0	X	0	All outputs forced to 0
1	1	1	0	0	1	0	0	0	0	0	0	0	0	X	0	All outputs forced to 1
1	1	1	0	0	1	1	0	0	0	0	0	0	0	X	0	Each output bit toggles between 0 and 1. ⁽²⁾⁽³⁾
															Power Down	
				PDN												
1	1	1	1	0	0	0	0	0	0	0	0	0	0	X	0	Normal mode of operation
1	1	1	1	1	0	0	0	0	0	0	0	0	0	X	0	Device is put in power-down (low-current) mode.

- (1) The register contents default to the appropriate setting for normal operation up on RESET.
- (2) The patterns given are applicable to the straight offset binary output format. If two's complement output format is selected, the test mode outputs will be the binary two's complement equivalent of these patterns as described in the *Output Information* section.
- (3) While each bit toggles between 1 and 0 in this mode, there is no assured phase relationship between the data bits D0 through D10. For example, when D0 is a 1, D1 is not assured to be a 0, and vice versa.

Table 3. Data Format Select (DFS) Table

DFS-PIN VOLTAGE (V_{DFS})	DATA FORMAT	CLOCK OUTPUT POLARITY
$V_{DFS} < \frac{2}{12} \times AV_{DD}$	Straight Binary	Data valid on rising edge
$\frac{4}{12} \times AV_{DD} < V_{DFS} < \frac{5}{12} \times AV_{DD}$	Two's Complement	Data valid on rising edge
$\frac{7}{12} \times AV_{DD} < V_{DFS} < \frac{8}{12} \times AV_{DD}$	Straight Binary	Data valid on falling edge
$V_{DFS} > \frac{10}{12} \times AV_{DD}$	Two's Complement	Data valid on falling edge

PIN CONFIGURATION

PIN CONFIGURATION (continued)
PIN ASSIGNMENTS⁽¹⁾

TERMINAL		NO. OF PINS	I/O	DESCRIPTION
NAME	NO.			
AV _{DD}	5, 7, 9, 15, 22, 24, 26, 28, 33, 34, 37, 39	12	I	Analog power supply
A _{GND}	6, 8, 12, 13, 14, 16, 18, 21, 23, 25, 27, 32, 36, 38	14	I	Analog ground
DRV _{DD}	49, 58	2	I	Output driver power supply
DR _{GND}	1, 42, 48, 50, 57, 59	6	I	Output driver ground
NC	44, 45, 46	2	—	Not connected
INP	19	1	I	Differential analog input (positive)
INM	20	1	I	Differential analog input (negative)
REFP	29	1	O	Reference voltage (positive); 0.1- μ F capacitor in series with a 1- Ω resistor to GND
REFM	30	1	O	Reference voltage (negative); 0.1- μ F capacitor in series with a 1- Ω resistor to GND
IREF	31	1	I	Current set; 56-k Ω resistor to GND; do not connect capacitors
CM	17	1	O	Common-mode output voltage
RESET	35	1	I	Reset (active high), 200-k Ω resistor to AV _{DD} ⁽²⁾
OE	41	1	I	Output enable (active high)
DFS	40	1	I	Data format and clock out polarity select ⁽³⁾⁽⁴⁾
CLKP	10	1	I	Data converter differential input clock (positive)
CLKM	11	1	I	Data converter differential input clock (negative)
SEN	4	1	I	Serial interface chip select ⁽⁴⁾
SDATA	3	1	I	Serial interface data ⁽⁴⁾
SCLK	2	1	I	Serial interface clock ⁽⁴⁾
D0 (LSB) to D10 (MSB)	47, 51-56, 60-63	11	O	11 bit parallel data output
OVR	64	1	O	Over-range indicator bit
CLKOUT	43	1	O	CMOS clock out in sync with data

(1) PowerPAD is connected to analog ground.

(2) If unused, the RESET pin should be tied to AGND. See the serial programming interface section for details.

(3) [Table 3](#) defines the voltage levels for each mode selectable via the DFS pin.

(4) Pins OE, DFS, SEN, SDATA, and SCLK have internal clamping diodes to the DRVDD supply. Any external circuit driving these pins must also run off the same supply voltage as DRVDD.

DEFINITION OF SPECIFICATIONS

Analog Bandwidth

The analog input frequency at which the power of the fundamental is reduced by 3 dB with respect to the low frequency value.

Aperture Delay

The delay in time between the falling edge of the input sampling clock and the actual time at which the sampling occurs.

Aperture Uncertainty (Jitter)

The sample-to-sample variation in aperture delay.

Clock Pulse Width/Duty Cycle

The duty cycle of a clock signal is the ratio of the time the clock signal remains at a logic high (clock pulse width) to the period of the clock signal. Duty cycle is typically expressed as a percentage. A perfect differential sine wave clock results in a 50% duty cycle.

Maximum Conversion Rate

The maximum sampling rate at which certified operation is given. All parametric testing is performed at this sampling rate unless otherwise noted.

Minimum Conversion Rate

The minimum sampling rate at which the ADC functions.

Differential Nonlinearity (DNL)

An ideal ADC exhibits code transitions at analog input values spaced exactly 1 LSB apart. The DNL is the deviation of any single step from this ideal value, measured in units of LSBs.

Integral Nonlinearity (INL)

The INL is the deviation of the ADC's transfer function from a best fit line determined by a least squares curve fit of that transfer function, measured in units of LSBs.

Gain Error

The gain error is the deviation of the ADC's actual input full-scale range from its ideal value. The gain error is given as a percentage of the ideal input full-scale range. Gain error does not account for variations in the internal reference voltages (see the *Electrical Specifications* section for limits on the variation of V_{REFP} and V_{REFM}).

Offset Error

The offset error is the difference, given in number of LSBs, between the ADC's actual average idle channel output code and the ideal average idle channel output code. This quantity is often mapped into mV.

Temperature Drift

The temperature drift coefficient (with respect to gain error and offset error) specifies the change per degree Celsius of the parameter from T_{MIN} to T_{MAX} . It is calculated by dividing the maximum deviation of the parameter across the T_{MIN} to T_{MAX} range by the difference ($T_{MAX} - T_{MIN}$).

Signal-to-Noise Ratio (SNR)

SNR is the ratio of the power of the fundamental (P_S) to the noise floor power (P_N), excluding the power at dc and the first eight harmonics.

$$SNR = 10\text{Log}_{10} \frac{P_S}{P_N}$$

SNR is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference or dBFS (dB to Full-Scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

Signal-to-Noise and Distortion (SINAD)

SINAD is the ratio of the power of the fundamental (P_S) to the power of all the other spectral components including noise (P_N) and distortion (P_D), but excluding dc.

$$SINAD = 10\text{Log}_{10} \frac{P_S}{P_N + P_D}$$

SINAD is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference or dBFS (dB to full-scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

Effective Number of Bits (ENOB)

The ENOB is a measure of a converter's performance as compared to the theoretical limit based on quantization noise.

$$ENOB = \frac{SINAD - 1.76}{6.02}$$

Total Harmonic Distortion (THD)

THD is the ratio of the power of the fundamental (P_S) to the power of the first eight harmonics (P_D).

$$\text{THD} = 10\text{Log}_{10} \frac{P_S}{P_D}$$

THD is typically given in units of dBc (dB to carrier).

Spurious-Free Dynamic Range (SFDR)

The ratio of the power of the fundamental to the highest other spectral component (either spur or harmonic). SFDR is typically given in units of dBc (dB to carrier).

Two-Tone Intermodulation Distortion (IMD3)

IMD3 is the ratio of the power of the fundamental (at frequencies f_1 and f_2) to the power of the worst spectral component at either frequency $2f_1 - f_2$ or $2f_2 - f_1$. IMD3 is either given in units of dBc (dB to carrier) when the absolute power of the fundamental is used as the reference, or dBFS (dB to Full-Scale) when the power of the fundamental is extrapolated to the converter's full-scale range.

DC Power Supply Rejection Ration (DC PSRR)

The DC PSRR is the ratio of the change in offset error to a change in analog supply voltage. The DC PSRR is typically given in units of mV/V.

Reference Error

The reference error is the variation of the actual reference voltage ($V_{REFP} - V_{REFM}$) from its ideal value. The reference error is typically given as a percentage.

Voltage Overload Recovery Time

The voltage overload recovery time is defined as the time required for the ADC to recover to within 1% of the full-scale range in response to an input voltage overload of 10% beyond the full-scale range.

TYPICAL CHARACTERISTICS

Typical values given at $T_A = 25^\circ\text{C}$, $AV_{DD} = DRV_{DD} = 3.3\text{ V}$, differential input amplitude = -1 dBFS, sampling rate = 125 MSPS, DLL On, and 3-V differential clock, unless otherwise noted

APPLICATION INFORMATION

THEORY OF OPERATION

The ADS5510 is a low-power, 11-bit, 125 MSPS, CMOS, switched capacitor, pipeline ADC that operates from a single 3.3-V supply. The conversion process is initiated by a falling edge of the external input clock. Once the signal is captured by the input S&H, the input sample is sequentially converted by a series of small resolution stages, with the outputs combined in a digital correction logic block. Both the rising and the falling clock edges are used to propagate the sample through the pipeline every half clock cycle. This process results in a data latency of 17.5 clock cycles, after which the output data is available as a 11-bit parallel word, coded in either straight offset binary or binary two's complement format.

INPUT CONFIGURATION

The analog input for the ADS5510 consists of a differential sample-and-hold architecture implemented using the switched capacitor technique shown in Figure 24.

- A. All Switches are ON in sampling phase which is approximately one half of a clock period.

Figure 24. Analog Input Stage

This differential input topology produces a high level of ac-performance for high sampling rates. It also results in a very high usable input bandwidth, especially important for high intermediate-frequency (IF) or undersampling applications. The ADS5510 requires each of the analog inputs (INP, INM) to be externally biased around the common-mode level of the internal circuitry (CM, pin 17). For a full-scale differential input, each of the differential lines of the input signal (pins 19 and 20) swings symmetrically between $CM + 0.575\text{ V}$ and $CM - 0.575\text{ V}$. This means that each input is driven with a signal of up to $CM \pm 0.575\text{ V}$, so that each input has a maximum differential signal of 1.15 V_{PP} for a total differential input signal swing of 2.3 V_{PP} . The maximum swing is determined by the two reference voltages, the top reference (REFP, pin 29), and the bottom reference (REFM, pin 30).

The ADS5510 obtains optimum performance when the analog inputs are driven differentially. The circuit shown in [Figure 25](#) illustrates one possible configuration using an RF transformer.

Figure 25. Transformer Input to Convert Single-Ended Signal to Differential Signal

The single-ended signal is fed to the primary winding of an RF transformer. Placing a $25\text{-}\Omega$ resistor in series with INP and INM is recommended to dampen ringing due to ADC kickback.

Since the input signal must be biased around the common-mode voltage of the internal circuitry, the common-mode voltage (V_{CM}) from the ADS5510 is connected to the center-tap of the secondary winding.

To ensure a steady low-noise V_{CM} reference, best performance is attained when the CM output (pin 17) is filtered to ground with a $10\text{-}\Omega$ series resistor and parallel $0.1\text{-}\mu\text{F}$ and $0.001\text{-}\mu\text{F}$ low-inductance capacitors, as illustrated in [Figure 24](#).

Output V_{CM} (pin 17) is designed to directly drive the ADC input. When providing a custom CM level, be aware that the input structure of the ADC sinks a common-mode current in the order of $600\text{ }\mu\text{A}$ ($300\text{ }\mu\text{A}$ per input). [Equation 1](#) describes the dependency of the common-mode current and the sampling frequency:

$$\frac{600\mu\text{A} \times f_s \text{ (in MSPS)}}{125 \text{ MSPS}} \quad (1)$$

Where:

$$f_s > 2 \text{ MSPS.}$$

This equation helps to design the output capability and impedance of the driving circuit accordingly.

When it is necessary to buffer or apply a gain to the incoming analog signal, it is possible to combine single-ended operational amplifiers with an RF transformer, or to use a differential input/output amplifier without a transformer, to drive the input of the ADS5510. Texas Instruments offers a wide selection of single-ended operational amplifiers (including the THS3201, THS3202, OPA695, and OPA847) that can be selected depending on the application. An RF gain block amplifier, such as Texas Instruments THS9001, can also be used with an RF transformer for high input frequency applications. The THS4503 is a recommended differential input/output amplifier. [Table 4](#) lists the recommended amplifiers.

Table 4. Recommended Amplifiers to Drive the Input of the ADS5510

INPUT SIGNAL FREQUENCY	RECOMMENDED AMPLIFIER	TYPE OF AMPLIFIER	USE WITH TRANSFORMER?
DC to 20 MHz	THS4503	Differential In/Out Amp	No
DC to 50 MHz	OPA847	Operational Amp	Yes
DC to 100 MHz	THS4509	Differential In/Out Amp	No
10 MHz to 120 MHz	OPA695	Operational Amp	Yes
	THS3201	Operational Amp	Yes
	THS3202	Operational Amp	Yes
Over 100 MHz	THS9001	RF Gain Block	Yes

When using single-ended operational amplifiers (such as the THS3201, THS3202, OPA695, or OPA847) to provide gain, a three-amplifier circuit is recommended with one amplifier driving the primary of an RF transformer and one amplifier in each of the legs of the secondary driving the two differential inputs of the ADS5510. These three amplifier circuits minimize even-order harmonics. For high frequency inputs, an RF gain block amplifier can be used to drive a transformer primary; in this case, the transformer secondary connections can drive the input of the ADS5510 directly, as shown in Figure 25, or with the addition of the filter circuit shown in Figure 26.

Figure 26 illustrates how R_{IN} and C_{IN} can be placed to isolate the signal source from the switching inputs of the ADC and to implement a low-pass RC filter to limit the input noise in the ADC. It is recommended that these components be included in the ADS5510 circuit layout when any of the amplifier circuits discussed previously are used. The components allow fine-tuning of the circuit performance. Any mismatch between the differential lines of the ADS5510 input produces a degradation in performance at high input frequencies, mainly characterized by an increase in the even-order harmonics. In this case, special care should be taken to keep as much electrical symmetry as possible between both inputs.

Another possible configuration for lower-frequency signals is the use of differential input/output amplifiers that can simplify the driver circuit for applications requiring dc-coupling of the input. Flexible in their configurations (see Figure 27), such amplifiers can be used for single-ended-to-differential conversion signal amplification.

Figure 26. Converting a Single-Ended Input Signal to a Differential Signal Using an RF Transformer

Figure 27. Using the THS4503 with the ADS5510

POWER-SUPPLY SEQUENCE

The preferred power-up sequence is to ramp AV_{DD} first, followed by DRV_{DD} , including a simultaneous ramp of AV_{DD} and DRV_{DD} . In the event that DRV_{DD} ramps up first in the system, care must be taken to ensure that AV_{DD} ramps up within 10 ms. Optionally, it is recommended to put a 2-k Ω resistor from REFP (pin 29) to AV_{DD} as shown in Figure 28. This helps to make the device more robust to power supply ramp-up timings.

Figure 28.

POWER-DOWN

The device enters power-down in one of two ways: either by reducing the clock speed or by setting the PDN bit throughout the serial programming interface. Using the reduced clock speed, power-down may be initiated for clock frequency below 2 MSPS. The exact frequency at which the power down occurs varies from device to device.

Using the serial interface PDN bit to power down the device places the outputs in a high-impedance state and only the internal reference remains on to reduce the power-up time. The power-down mode reduces power dissipation to approximately 180 mW.

REFERENCE CIRCUIT

The ADS5510 has built-in internal reference generation, requiring no external circuitry on the printed circuit board (PCB). For optimum performance, it is best to connect both REFP and REFM to ground with a 1- μ F decoupling capacitor (the 1- Ω resistor shown in Figure 29 is optional). In addition, an external 56.2-k Ω resistor should be connected from IREF (pin 31) to AGND to set the proper current for the operation of the ADC, as shown in Figure 29. No capacitor should be connected between pin 31 and ground; only the 56.2-k Ω resistor should be used.

Figure 29. REFP, REFM, and IREF Connections for Optimum Performance

CLOCK INPUT

The ADS5510 clock input can be driven with either a differential clock signal or a single-ended clock input, with little or no difference in performance between both configurations. The common-mode voltage of the clock inputs is set internally to CM (pin 17) using internal 5-k Ω resistors that connect CLKP (pin 10) and CLKM (pin 11) to CM (pin 17), as shown in Figure 30.

Figure 30. Clock Inputs

When driven with a single-ended CMOS clock input, it is best to connect CLKM (pin 11) to ground with a 0.01- μ F capacitor, while CLKP is ac-coupled with a 0.01- μ F capacitor to the clock source, as shown in Figure 31.

Figure 31. AC-Coupled, Single-Ended Clock Input

The ADS5510 clock input can also be driven differentially, reducing susceptibility to common-mode noise. In this case, it is best to connect both clock inputs to the differential input clock signal with 0.01- μ F capacitors, as shown in Figure 32.

Figure 32. AC-Coupled, Differential Clock Input

For high input frequency sampling, it is recommended to use a clock source with low jitter. Additionally, the internal ADC core uses both edges of the clock for the conversion process. This means that, ideally, a 50% duty cycle should be provided. Figure 19 shows the performance variation of the ADC versus clock duty cycle.

Bandpass filtering of the source can help produce a 50% duty cycle clock and reduce the effect of jitter. When using a sinusoidal clock, the clock jitter further improves as the amplitude is increased. In that sense, using a differential clock allows for the use of larger amplitudes without exceeding the supply rails and absolute maximum ratings of the ADC clock input. Figure 18 shows the performance variation of the device versus input clock amplitude. For detailed clocking schemes based on transformer or PECL-level clocks, see the ADS55xxEVM User's Guide (SLWU010), available for download from www.ti.com.

INTERNAL DLL

In order to obtain the fastest sampling rates achievable with the ADS5510, the device uses an internal digital delay lock loop (DLL). Nevertheless, the limited frequency range of operation of DLL degrades the performance at clock frequencies below 60 MSPS. In order to operate the device below 60 MSPS, the internal DLL must be shut off using the DLL OFF mode described in the *Serial Interface Programming* section. The *Typical Performance Curves* show the performance obtained in both modes of operation: DLL ON (default) and DLL OFF. In either of the two modes, the device enters power-down mode if no clock or slow clock is provided. The limit of the clock frequency where the device functions properly with default settings is ensured to be over 2 MHz.

OUTPUT INFORMATION

The ADC provides 11 data outputs (D10 to D0, with D10 being the MSB and D0 the LSB), a data-ready signal (CLKOUT, pin 43), and an out-of-range indicator (OVR, pin 64) that equals 1 when the output reaches the full-scale limits.

Two different output formats (straight offset binary or two's complement) and two different output clock polarities (latching output data on rising or falling edge of the output clock) can be selected by setting DFS (pin 40) to one of four different voltages. Table 3 details the four modes. In addition, output enable control (OE, pin 41, active high) is provided to put the outputs into a high-impedance state.

In the event of an input voltage overdrive, the digital outputs go to the appropriate full-scale level. For a positive overdrive, the output code is 0x7FF in straight offset binary output format and 0x3FF in two's complement output format. For a negative input overdrive, the output code is 0x000 in straight offset binary output format and 0x400 in two's complement output format. These outputs to an overdrive signal are ensured through design and characterization.

The output circuitry of the ADS5510, by design, minimizes the noise produced by the data switching transients, and, in particular, its coupling to the ADC analog circuitry. Output D1 (pin 51) senses the load capacitance and adjusts the drive capability of all the output pins of the ADC to maintain the same output slew rate described in the timing diagram of Figure 1. Care should be taken to ensure that all output lines (including CLKOUT) have nearly the same load as D1 (pin 51). This circuit also reduces the sensitivity of the output timing versus supply voltage or temperature. Placing external resistors in series with the outputs is **not** recommended.

The timing characteristics of the digital outputs change for sampling rates below the 125 MSPS maximum sampling frequency. Table 5 and Table 6 show the setup, hold, input clock to output data delays, and rise and fall times for different sampling frequencies with the DLL on and off, respectively.

Table 7 and Table 8 show the rise and fall times at additional sampling frequencies with DLL on and off, respectively.

To use the input clock as the data capture clock, it is necessary to delay the input clock by a delay, t_d , that results in the desired setup or hold time. Use either Equation 2 or Equation 3 to calculate the value of t_d .

$$\text{Desired setup time} = t_d - t_{\text{START}}$$

$$\text{Desired hold time} = t_{\text{END}} - t_d$$

SERIAL PROGRAMMING INTERFACE

The ADS5510 has internal registers for the programming of some of the modes described in the previous sections. The registers should be reset after power-up by applying a 2 μ s (minimum) high pulse on RESET (pin 35); this also resets the entire ADC and sets the data outputs to low. This pin has a 200-k Ω internal pullup resistor to AVDD. The programming is done through a three-wire interface. The timing diagram and serial register setting in the *Serial Programming Interface* section describe the programming of this register.

Table 2 shows the different modes and the bit values to be written to the register to enable them.

Note that some of these modes may modify the standard operation of the device and possibly vary the performance with respect to the typical data shown in this data sheet.

Applying a RESET signal is *must* to set the internal registers to their default states for normal operation. If the hardware RESET function is not used in the system, the RESET pin must be tied to ground and it is necessary to write the default values to the internal registers through the serial programming interface. The registers must be written in the following order.

- Write 9000h (Address 9, Data 000)
- Write A000h (Address A, Data 000)
- Write B000h (Address B, Data 000)
- Write C000h (Address C, Data 000)
- Write D000h (Address D, Data 000)
- Write E000h (Address E, Data 804)
- Write 0000h (Address 0, Data 000)
- Write 1000h (Address 1, Data 000)
- Write F000h (Address F, Data 000)

NOTE:

This procedure is only required if a RESET pulse is not provided to the device.

PowerPAD PACKAGE

The PowerPAD package is a thermally enhanced standard size IC package designed to eliminate the use of bulky heatsinks and slugs traditionally used in thermal packages. This package can be easily mounted using standard printed circuit board (PCB) assembly techniques and can be removed and replaced using standard repair procedures.

The PowerPAD package is designed so that the lead frame die pad (or thermal pad) is exposed on the bottom of the IC. This provides a low thermal resistance path between the die and the exterior of the package. The thermal pad on the bottom of the IC can then be soldered directly to the printed circuit board (PCB), using the PCB as a heatsink.

Assembly Process

1. Prepare the PCB top-side etch pattern including etch for the leads as well as the thermal pad as illustrated in the *Mechanical Data* section. The recommended thermal pad dimension is 8 mm x 8 mm.
2. Place a 5-by-5 array of thermal vias in the thermal pad area. These holes should be 13 mils in diameter. The small size prevents wicking of the solder through the holes.
3. It is recommended to place a small number of 25 mil diameter holes under the package, but outside the thermal pad area to provide an additional heat path.
4. Connect all holes (both those inside and outside the thermal pad area) to an internal copper plane (such as a ground plane).
5. Do not use the typical web or spoke via connection pattern when connecting the thermal vias to the ground plane. The spoke pattern increases the thermal resistance to the ground plane.
6. The top-side solder mask should leave exposed the terminals of the package and the thermal pad area.
7. Cover the entire bottom side of the PowerPAD vias to prevent solder wicking.
8. Apply solder paste to the exposed thermal pad area and all of the package terminals.

For more detailed information regarding the PowerPAD package and its thermal properties, see either the application brief [SLMA004B](#) (*PowerPAD Made Easy*) or technical brief [SLMA002](#) (*PowerPAD Thermally Enhanced Package*).

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. Falls within JEDEC MS-026

PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. When the thermal pad is soldered directly to the printed circuit board (PCB), the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to a ground or power plane (whichever is applicable), or alternatively, a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
