

F100130 Triple D Latch

General Description

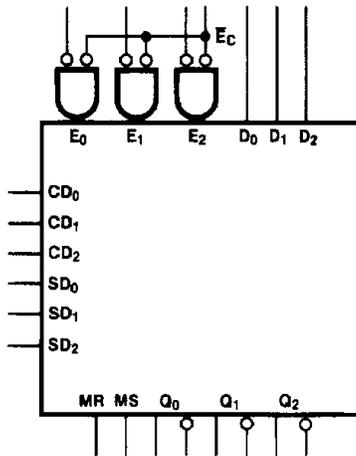

The F100130 contains three D-type latches with true and complement outputs and with Common Enable (\bar{E}_C), Master Set (MS) and Master Reset (MR) inputs. Each latch has its own Enable (\bar{E}_n), Direct Set (SD_n) and Direct Clear (CD_n) inputs. The Q output follows its Data (D) input when both \bar{E}_n and \bar{E}_C are LOW (transparent mode). When either \bar{E}_n or \bar{E}_C

(or both) are HIGH, a latch stores the last valid data present on its D_n input before \bar{E}_n or \bar{E}_C goes HIGH.

Both Master Reset (MR) and Master Set (MS) inputs override the Enable inputs. The individual CD_n and SD_n also override the Enable inputs. All inputs have 50 k Ω pull-down resistors.

Ordering Code: See Section 8

Note 1: Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Parametric values specified at -4.2V to -4.8V .

Note 3: The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

Note 4: Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
