

SMALL-OUTLINE DRAM MODULE

MT4LDT464H (X)(S), MT8LDT864H (X)(S)

 For the latest data sheet, please refer to the Micron Web site: www.micronsemi.com/datasheets/datasheet.html

FEATURES

- JEDEC pinout in a 144-pin, small-outline, dual in-line memory module (SODIMM)
- 32MB (4 Meg x 64) and 64MB (8 Meg x 64)
- High-performance CMOS silicon-gate process
- Single +3.3V $\pm 0.3V$ power supply
- All inputs, outputs and clocks are TTL-compatible
- 4,096-cycle CAS#-BEFORE-RAS# (CBR) refresh distributed across 64ms
- FAST PAGE MODE (FPM) or Extended Data-Out (EDO) PAGE MODE access cycles
- Optional Self Refresh Mode (S)
- Serial presence-detect (SPD)

OPTIONS

- Package
144-pin SODIMM (gold)
- Timing
50ns access
60ns access
- Access Cycles
FAST PAGE MODE
EDO PAGE MODE
- Refresh Rates
Standard Refresh
Self Refresh (128ms period)

GENERAL DESCRIPTION

The MT4LDT464H (X)(S) and MT8LDT864H (X)(S) are randomly accessed 32MB and 64MB memories organized in a small-outline, x64 configuration. They are specially processed to operate from 3V to 3.6V for low-voltage memory systems.

During READ or WRITE cycles, each location is uniquely addressed via the address bits. The row address is latched by the RAS# signal, then the column address is latched by the CAS# signal.

READ and WRITE cycles are selected with the WE# input. A logic HIGH on WE# dictates read mode, while a logic LOW on WE# dictates write mode. During a WRITE cycle, data-in (D) is latched by the falling edge of WE# or CAS#, whichever occurs last. An EARLY WRITE occurs when WE# is taken LOW prior to CAS# falling. A LATE WRITE or READ-MODIFY-WRITE occurs when WE# falls after CAS# is taken LOW. During EARLY WRITE cycles, the data outputs (Q) will remain High-Z, regardless of the state of OE#. During LATE WRITE or READ-MODIFY-WRITE cycles, OE# must be taken HIGH to disable the data outputs prior to applying input data. If a LATE WRITE or READ-MODIFY-WRITE is attempted while keeping OE# LOW, no WRITE will occur, and the data outputs will drive read data from the access location.

FAST PAGE MODE

FAST-PAGE-MODE operations allow faster data operations (READ or WRITE) within a row-address-defined page boundary. The FAST-PAGE-MODE cycle is always initiated with a row address strobed in by RAS#, followed by a column address strobed in by

CAS#. Additional columns may be accessed by providing valid column addresses, strobing CAS# and holding RAS# LOW, thus executing faster memory cycles. Returning RAS# HIGH terminates the FAST-PAGE-MODE operation.

EDO PAGE MODE

EDO PAGE MODE, designated by the "X" option, is an accelerated FAST-PAGE-MODE cycle. The primary advantage of EDO is the availability of data-out even after CAS# goes back HIGH. EDO provides for CAS# precharge time (^tCP) to occur without the output data going invalid. This elimination of CAS# output control provides for pipelined READs.

FAST-PAGE-MODE modules have traditionally turned the output buffers off (High-Z) with the rising edge of CAS#. EDO operates as any DRAM READ or FAST-PAGE-MODE READ, except data will be held valid after CAS# goes HIGH, as long as RAS# and OE# are held LOW and WE# is held HIGH. (Refer to the 8 Meg x 8 EDO DRAM data sheet for additional information on EDO functionality.)

REFRESH

Memory cell data is retained in its correct state by maintaining power and executing any RAS# cycle (READ, WRITE) or RAS# refresh cycle (RAS#-ONLY, CBR or HIDDEN) so that all combinations of RAS# addresses are executed at least every ^tREF, regardless of sequence. The CBR REFRESH cycle will invoke the internal refresh counter for automatic RAS# addressing.

An optional self refresh mode is also available on the "S" version. The "S" option allows the user the choice of a fully static, low-power data retention mode or a dynamic refresh mode at the extended refresh period of 128ms, or 125µs per row when using distributed CBR REFRESH. The optional self refresh feature is initiated by performing a CBR REFRESH cycle and holding RAS# LOW for the specified ^tRASS.

The self refresh mode is terminated by driving RAS# HIGH for a minimum time of ^tRPS. This delay allows for the completion of any internal refresh cycles that may be in process at the time of the RAS# LOW-to-HIGH transition. If the DRAM controller uses a distributed refresh sequence, a burst refresh is not required upon exiting self refresh. However, if the DRAM controller utilizes a RAS#-ONLY or burst refresh sequence, all 1,240 rows must be refreshed within the average internal refresh rate, prior to the resumption of normal operation.

STANDBY

Returning RAS# and CAS# HIGH terminates a memory cycle and decreases chip current to a reduced standby level. Also, the chip is preconditioned for the next cycle during the RAS# HIGH time.

SERIAL PRESENCE-DETECT OPERATION

This module family incorporates serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes can be programmed by Micron to identify the module type and various DRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device (DIMM) occur via a standard IIC bus using the DIMM's SCL (clock) and SDA (data) signals.

SPD CLOCK AND DATA CONVENTIONS

Data states on the SDA line can change only during SCL LOW. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (Figures 1 and 2).

Figure 1
Data Validity

Figure 2
Definition of Start and Stop

Figure 3
Acknowledge Response From Receiver

SPD START CONDITION

All commands are preceded by the start condition, which is a HIGH-to-LOW transition of SDA when SCL is HIGH. The SPD device continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

SPD STOP CONDITION

All communications are terminated by a stop condition, which is a LOW-to-HIGH transition of SDA when SCL is HIGH. The stop condition is also used to place the SPD device into standby power mode.

SPD ACKNOWLEDGE

Acknowledge is a software convention used to indicate successful data transfers. The transmitting device, either master or slave, will release the bus after transmitting eight bits. During the ninth clock cycle, the receiver will pull the SDA line LOW to acknowledge that it received the eight bits of data (Figure 3).

The SPD device will always respond with an acknowledge after recognition of a start condition and its slave address. If both the device and a WRITE

operation have been selected, the SPD device will respond with an acknowledge after the receipt of each subsequent eight-bit word. In the read mode the SPD device will transmit eight bits of data, release the SDA line and monitor the line for an acknowledge. If an acknowledge is detected and no stop condition is generated by the master, the slave will continue to transmit data. If an acknowledge is not detected, the slave will terminate further data transmissions and await the stop condition to return to standby power mode.

Stop condition setup time	$t_{SU:STO}$	4.7		μs	
WRITE cycle time	t_{WR}		10	ms	29

NOTES

1. All voltages referenced to V_{SS} .
2. This parameter is sampled. $V_{DD} = +3.3V$; $f = 1$ MHz.
3. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
4. Enables on-chip refresh and address counters.
5. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range is ensured.
6. An initial pause of 100 μ s is required after power-up, followed by eight RAS# REFRESH cycles (RAS#-ONLY or CBR with WE# HIGH), before proper device operation is ensured. The eight RAS# cycle wake-ups should be repeated any time the t_{REF} refresh requirement is exceeded.
7. AC characteristics assume $t_T = 5$ ns for FPM and $t_T = 2.5$ ns for EDO.
8. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
9. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
10. If CAS# = V_{IH} , data output is High-Z.
11. If CAS# = V_{IL} , data output may contain data from the last valid READ cycle.
12. Measured with a load equivalent to two TTL gates and 100pF and $V_{OL} = 0.8V$ and $V_{OH} = 2V$.
13. If CAS# is LOW at the falling edge of RAS#, Q will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, CAS# must be pulsed HIGH for t_{CP} .
14. The t_{RCD} (MAX) limit is no longer specified. t_{RCD} (MAX) was specified as a reference point only. If t_{RCD} was greater than the specified t_{RCD} (MAX) limit, then access time was controlled exclusively by t_{CAC} (t_{RAC} [MIN] no longer applied). With or without the t_{RCD} (MAX) limit, t_{AA} and t_{CAC} must always be met.
15. The t_{RAD} (MAX) limit is no longer specified. t_{RAD} (MAX) was specified as a reference point only. If t_{RAD} was greater than the specified t_{RAD} (MAX) limit, then access time was controlled exclusively by t_{AA} (t_{RAC} and t_{CAC} no longer applied). With or without the t_{RAD} (MAX) limit, t_{AA} , t_{RAC} and t_{CAC} must always be met.
16. Either t_{RCH} or t_{RRH} must be satisfied for a READ cycle.
17. t_{OFF} (MAX) defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL} .
18. These parameters are referenced to CAS# leading edge in EARLY WRITE cycles and WE# leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
19. If OE# is tied permanently LOW, LATE WRITE or READ-MODIFY-WRITE operations are not permissible and should not be attempted. Additionally, with EDO, WE# must be pulsed during CAS# HIGH time in order to place I/O buffers in High-Z.
20. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, WE# = LOW and OE# = HIGH.
21. The 3ns minimum is a parameter guaranteed by design.
22. Column address changed once each cycle.
23. 8MB module values will be half of those shown.
24. With the FPM option, t_{OFF} is determined by the first RAS# or CAS# signal to transition HIGH. In comparison, t_{OFF} on an EDO option is determined by the latter of the RAS# and CAS# signals to transition HIGH.
25. Applies to both FPM and EDO operating modes.
26. All other inputs at 0.2V or $V_{DD} - 0.2V$.
27. t_{WCS} , t_{RWD} , t_{AWD} and t_{CWD} are not restrictive operating parameters. t_{WCS} applies to EARLY WRITE cycles. t_{RWD} , t_{AWD} and t_{CWD} apply to READ-MODIFY-WRITE cycles. If $t_{WCS} \geq t_{WCS}$ (MIN), the cycle is an EARLY WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If $t_{WCS} < t_{WCS}$ (MIN) and $t_{RWD} \geq t_{RWD}$ (MIN), $t_{AWD} \geq t_{AWD}$ (MIN) and $t_{CWD} \geq t_{CWD}$ (MIN), the cycle is a READ-MODIFY-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of data-out is indeterminate. OE# held HIGH and WE# taken LOW after CAS# goes LOW result in a LATE WRITE (OE#-controlled) cycle. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not applicable in a LATE WRITE cycle.

NOTES (continued)

28. LATE WRITE and READ-MODIFY-WRITE cycles must have both t_{OD} and $t_{OE\#}$ met (OE# HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The DQs will provide the previously read data if CAS# remains LOW and OE# is taken back LOW after $t_{OE\#}$ is met. If CAS# goes HIGH prior to OE# going back LOW, the DQs will remain open.
29. The SPD EEPROM WRITE cycle time (t_{WR}) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal erase/program cycle. During the WRITE cycle, the EEPROM bus interface circuit is disabled, SDA remains HIGH due to pull-up resistor, and the EEPROM does not respond to its slave address.
30. V_{IH} overshoot: $V_{IH} (MAX) = V_{DD} + 2V$ for a pulse width $\leq 10ns$, and the pulse width cannot be greater than one third of the cycle rate. V_{IL} undershoot: $V_{IL} (MIN) = -2V$ for a pulse width $\leq 10ns$, and the pulse width cannot be greater than one third of the cycle rate.

tWCS	0		0		ns
tWP	8		10		ns

NOTE: 1. Do not drive data prior to tristate.

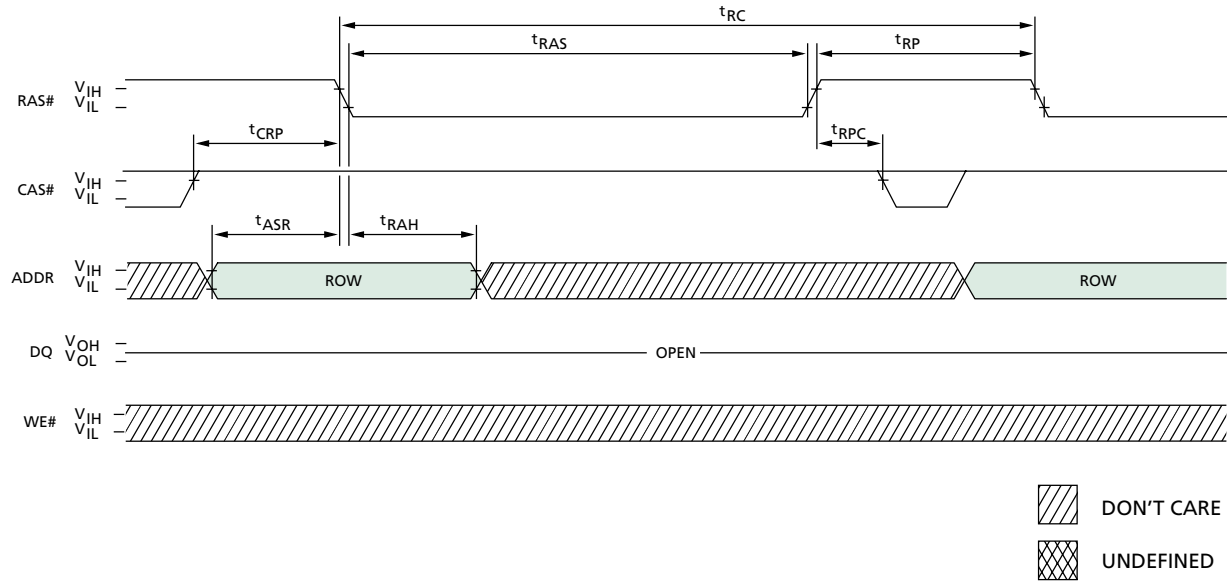

EDO READ CYCLE (with WE#-controlled disable)

EDO PAGE MODE TIMING PARAMETERS

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t_{AA}		25		30	ns
t_{AR}	38		45		ns
t_{ASC}	0		0		ns
t_{ASR}	0		0		ns
t_{CAC}		13		15	ns
t_{CAH}	8		10		ns
t_{CAS}	8	10,000	10	10,000	ns
t_{CLZ}	0		0		ns
t_{CP}	8		10		ns
t_{CRP}	5		5		ns
t_{CSH}	38		45		ns

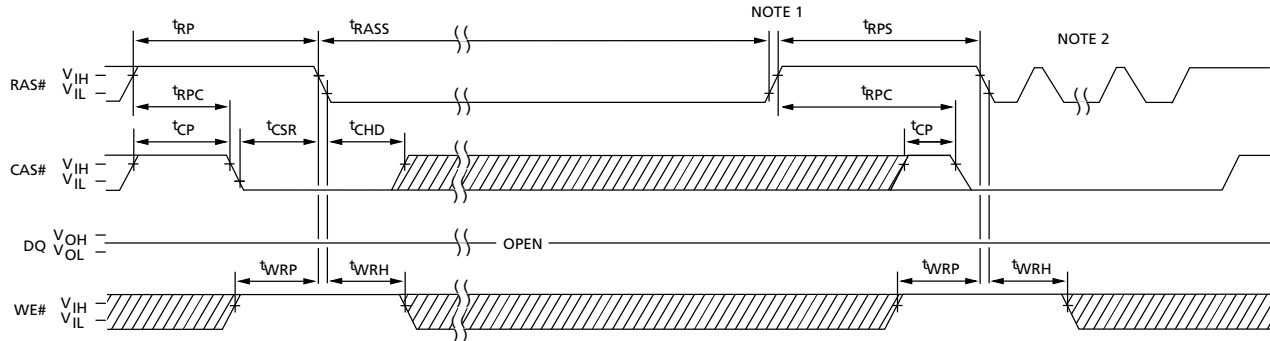

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t_{OD}	0	12	0	15	ns
t_{OE}		12		15	ns
t_{RAC}		50		60	ns
t_{RAD}	9		12		ns
t_{RAH}	9		10		ns
t_{RCD}	11		14		ns
t_{RCH}	0		0		ns
t_{RCS}	0		0		ns
t_{WHZ}	0	12	0	15	ns
t_{WPZ}	10		10		ns

RAS#-ONLY REFRESH CYCLE ²⁵

**FAST PAGE MODE AND EDO PAGE MODE
TIMING PARAMETERS**

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t_{ASR}	0		0		ns
t_{CRP}	5		5		ns
t_{RAH} (EDO)	9		10		ns
t_{RAH} (FPM)	8		10		ns
t_{RAS}	50	10,000	60	10,000	ns

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t_{RC} (FPM)	90		110		ns
t_{RC} (EDO)	84		104		ns
t_{RP}	30		40		ns
t_{RPC} (FPM)	0		0		ns
t_{RPC} (EDO)	5		5		ns

SELF REFRESH CYCLE (Addresses and OE# = DON'T CARE)

CBR REFRESH CYCLE ²⁵ (Addresses = DON'T CARE)

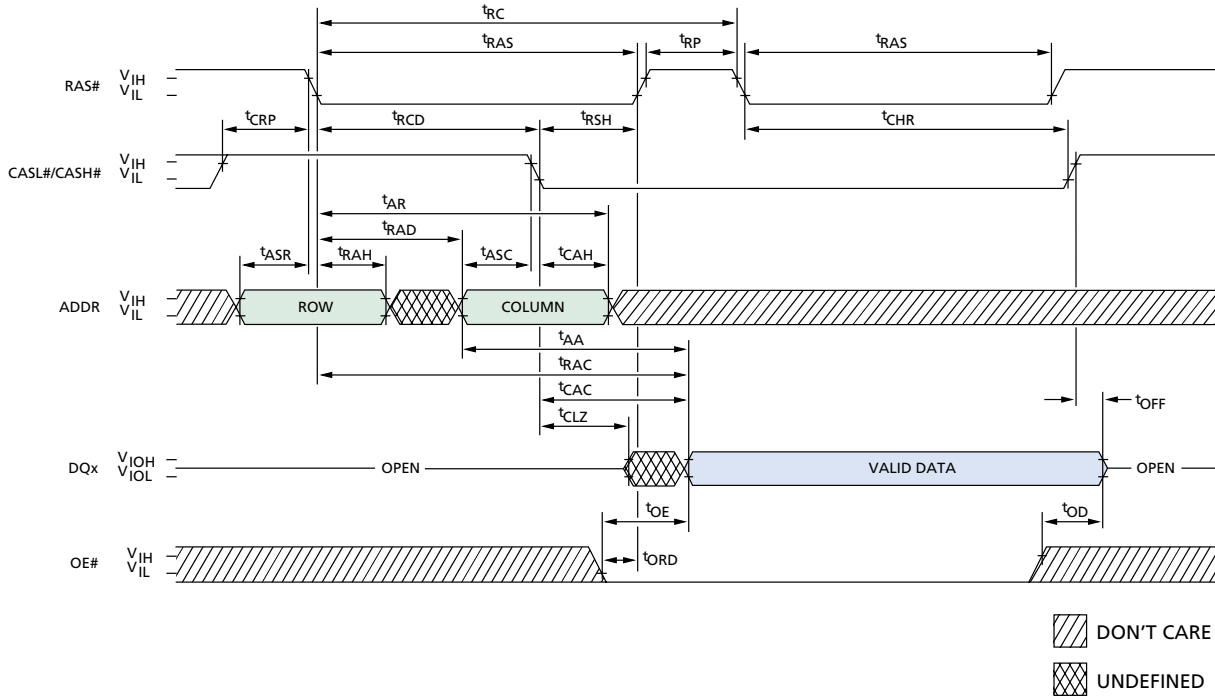

FAST PAGE MODE AND EDO PAGE MODE TIMING PARAMETERS

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t _{CHD}	15		15		ns
t _{CHR (FPM)}	15		15		ns
t _{CHR (EDO)}	8		10		ns
t _{CP}	8		10		ns
t _{CSR}	5		5		ns
t _{RAS}	50	10,000	60	10,000	ns
t _{RASS}	100		100		μs
t _{RP}	30		40		ns

SYMBOL	-5		-6		UNITS
	MIN	MAX	MIN	MAX	
t _{RPC (FPM)}	0		0		ns
t _{RPC (EDO)}	5		5		ns
t _{RPS}	90		105		ns
t _{WRH (EDO)}	8		10		ns
t _{WRP (EDO)}	8		10		ns
t _{WRN (FPM)}	10		10		ns
t _{WRP (FPM)}	10		10		ns

- NOTE:** 1. Once t_{RASS} (MIN) is met and RAS# remains LOW, the DRAM will enter self refresh mode.
2. Once t_{RPS} is satisfied, a complete burst of all rows should be executed.

**HIDDEN REFRESH CYCLE^{20, 25}
(WE# = HIGH)**

DON'T CARE
 UNDEFINED

**FAST PAGE MODE AND EDO PAGE MODE
