

50mA and 150mA CMOS Linear Regulators

FEATURES

- Very low Dropout Voltage: 200mV typ (150mA load)
- High Output Setpoint Accuracy of 2%
- Very low Input Voltages Down to 1.6V
- Power-saving Shutdown Mode of 150nA (typ)
- Fast Turn-on (90µs) and Turn-off (90µs)
- Extremely low Quiescent Current of 14µA (typ)
- Very Tight Line regulation, 0.2%/V
- Load Regulation 0.125 mV/mA
- Thermal Shutdown Protection
- Low Noise Output, 100µVRMS With 10nF Bypass
- Fixed or Adjustable Output Versions Available
- Available in RoHS Compliant, Lead Free Packages: SC70 and SOT23

APPLICATIONS

- Cellular Telephones
- Laptop, Notebooks and Palmtop Computers
- Battery-Powered Equipment
- Consumer/ Personal Electronics
- SMPS Post-Regulator
- DC-to-DC Modules
- Medical Devices
- Data Cable
- Pagers

DESCRIPTION

The SP6222 and SP6223 are CMOS LDOs designed to meet a broad range of applications that require accuracy, speed and ease of use. These LDOs offer extremely low quiescent current which only increases slightly under load, thus providing advantages in ground current performance over bipolar LDOs. The LDOs handle an extremely wide load range and guarantee stability with a 1µF ceramic output capacitor. They have excellent low frequency PSRR, not found in other CMOS LDOs and thus offer exceptional Line Regulation. High frequency PSRR is 55dB (typical) at 1kHz. Load Regulation is excellent and temperature stability is comparable to bipolar LDOs. An enable feature is provided on all versions. The SP6222/6223 is available in fixed and adjustable output voltage versions in industry standard SC70 and SOT23 packages.

Dropout Voltage (DOV), Note 3		60 200	100 300	mV	$I_{OUT} = 50mA$ (SP6222) $I_{OUT} = 150mA$ (SP6223)
Ground Pin Current		14	25	μA	$I_{OUT} = 0.1mA$

Note 1. The maximum allowable power dissipation at any T_A (ambient temperature) is $P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. The θ_{JA} of the SP6222/23 (SC-70-5) is 330°C/W mounted on a PC board with minimum copper area (see “Thermal Considerations” section for further details).

Note 2. Minimum V_{IN} must meet 2 conditions: $V_{IN} > 1.6V$ and $V_{IN} \geq \{V_{OUT} + DOV\}$

Note 3. Dropout Voltage DOV is defined as the input to output differential at which the output voltage drops 2% below its nominal value measured at 1V differential. The DOV specification is not applicable to output voltages less than 2.7V.

ELECTRICAL CHARACTERISTICS

Unless otherwise specified: $V_{IN} = V_{OUT} + 0.3V$ to 4.5V, $C_{OUT} = 1\mu F$ ceramic, $C_{IN} = 1\mu F$ ceramic, $I_{OUT} = 100\mu A$, $T_A = 25^\circ C$.
Bold values apply over the full operating temperature range (-40°C to 125°C).

PIN DESCRIPTION

Pin Name	Pin Number		Description
	5 pin SC-70	5 pin SOT23	
V_{IN}	1	1	Power supply input. Connect a 1uF decoupling capacitor next to this pin.
GND	2	2	Ground Pin.
EN	3	3	Enable/Shutdown (Logic high = enable, logic low = shutdown)
BYP	4 (Fixed)	4 (Fixed)	Reference bypass input for ultra-quiet operation. Connecting 10nF capacitor from this pin to ground reduces output noise
ADJ	4 (Adjustable)	4 (Adjustable)	Adjustable regulator feedback input. Connect to a resistive voltage-divider network.
V_{OUT}	5	5	Output voltage of the linear regulator. Connect a 1uF or larger capacitor from this pin to ground.

General Overview

The SP6222 and SP6223 are CMOS LDOs designed to meet a broad range of low voltage applications that require accuracy and ease of use. The SP6222 offers a 50mA output current while the SP6223 offers an output current of 150mA. The SP6222 is available in a 2.5V or 3.0V fixed output along with an adjustable output version. The SP6223 is offered in an adjustable output only. These LDOs have a minimum input voltage of only 1.6V and a maximum input voltage of 4.5V. The output voltage can be programmed to as low as 0.9V and have a maximum dropout voltage rating of 100mV for the SP6222 and 300mV for the SP6223. Both devices are equipped with an enable (EN) input for very low current (10nA typical) shutdown mode.

Enable / Shutdown Operation

The SP6222/6223 is turned on by providing 1.6V or greater to the EN pin. To place the device into shutdown pull the EN pin below 0.4V. If this feature is not required connect EN to input supply to always enable the device whenever power is applied.

Input / Output Capacitor

The SP6222/6223 is designed to operate using very small ceramic capacitors. The minimum input and output capacitor value for stable operation is 1.0 μ F. The output capacitor value may be increased without limit to improve transient response. Place these capacitors as close as possible to the device.

Bypass (BYP) Capacitor

The fixed output versions offer a BYP pin to decouple the bandgap reference. Connecting an external 10nF capacitor from BYP to GND can reduce output noise. If output noise is not a concern the BYP pin may be left open. When a bypass capacitor is used the turn on time is slower. See the following turn on time plots for various BYP capacitor values. The adjustable output version does not offer this BYP input.

Adjustable Regulator

The output of the device can be programmed to a specific voltage by using two external resistors connected to the ADJ pin (see Typical Application Circuit for Adjustable output). The resistors set

the output voltage based on the following equation:

$$V_{OUT} = V_{REF} * (R1/R2 + 1)$$

Resistor values are not critical because the ADJ (adjust) pin has a high impedance, but for best performance use resistor values of 470K Ω or less.

Thermal Considerations

The SP6222/6223 is designed to provide 50mA -150mA of continuous current in a tiny package. Maximum power dissipation can be calculated based on the output current and the voltage drop across the part. To determine the maximum power dissipation of the package, use the junction-to-ambient thermal resistance of the device and the following equation:

$$P_{D(MAX)} = (T_{J(max)} - T_A) / \theta_{JA}$$

$T_{J(max)}$ is the maximum junction temperature of the die and is 125°C. T_A is the ambient temperature. θ_{JA} is the junction-to-ambient thermal resistance of the package. The SOT-23 package has a θ_{JA} of approximately 191°C/W and the SC70 package has a θ_{JA} of approximately 330°C/W.

The actual power dissipation of the regulator circuit can be determined by using the simplified equation:

$$P_D = (V_{IN} - V_{OUT}) * I_{OUT}$$

To prevent the device from entering thermal shutdown, maximum power dissipation cannot be exceeded.

Layout Considerations

The primary path of heat conduction out of the package is via the package leads. Therefore, careful consideration must be taken into account for optimizing layout.

1. Attaching the part to a large copper footprint will enable better heat transfer from the device, especially where there are internal ground and power planes.
2. Place the input and output capacitors close to the device for optimal transient response and device behavior.
3. Connect all ground connections directly to the ground plane. In case there is no ground plane, connect to a common ground point before connecting to board ground.
