3.3V/5V 3.2Gbps CML LOW-POWER LIMITING POST AMPLIFIER w/TTL SD

SY88823V

FEATURES

- **Multi-rate up to 3.2Gbps operation**
- **Wide gain-bandwidth product**
  - **38dB differential gain**
  - **2GHz 3dB bandwidth**
- **Low noise 50Ω CML data outputs**
  - **800mV$_{pp}$ output swing**
  - **60ps edge rates**
  - **5ps$_{rms}$ typ. random jitter**
  - **15ps$_{pp}$ typ. deterministic jitter**
- **Chatter-free, Signal-Detect (SD) output**
  - **4.6dB electrical hysteresis**
  - **OC-TTL output with internal 4.75kΩ pull-up resistor**
- **Programmable SD sensitivity using single external resistor**
- **Integrated input bias reference**
- **TTL EN input allows feedback from SD**
- **Wide operating range**
  - **Single 3.3V ±10% or 5V ±10% power supply**
  - **–40°C to +85°C ambient industrial temperature range**
- **Available in tiny 10-pin EPAD-MSOP and 16-pin MLF™ packages**

APPLICATIONS

- **1.25Gbps and 2.5Gbps Gigabit Ethernet**
- **1.062Gbps and 2.125Gbps Fibre Channel**
- **155Mbps, 622Gbps, 1.25Gbps, and 2.5Gbps SONET/SDH**
- **Gigabit interface converter (GBIC)**
- **Small form factor (SFF) and small form factor pluggable (SFP) transceivers**
- **Parallel 10G Ethernet**
- **High-gain line driver and line receiver**

DESCRIPTION

The SY88823V low-power, limiting post amplifier is designed for use in fiber optic receivers. The device connects to typical transimpedance amplifiers (TIAs). The linear signal output from TIAs can contain significant amounts of noise and may vary in amplitude over time. The SY88823V quantizes these signals and outputs typically 800mV$_{PP}$ voltage-limited waveforms.

The SY88823V operates from a single +3.3V ±10% or +5V ±10% power supply, over an industrial temperature range of –40°C to +85°C. With its wide bandwidth and high gain, signals with data rates up to 3.2Gbps and as small as 10mV$_{pp}$ can be amplified to drive devices with CML inputs or AC-coupled PECL inputs.

The SY88823V incorporates a signal detect (SD), open-collector TTL output with internal 4.75kΩ pull-up resistor. A programmable, signal-detect level set pin (SDLVL) sets the sensitivity of the input amplitude detection. SD asserts high if the input amplitude rises above the threshold set by SDLVL and de-asserts low otherwise. SD can be fed back to the enable (EN) input to maintain output stability under a loss-of-signal condition. EN de-asserts the true output signal without removing the input signal. Typically 4.6dB SD hysteresis is provided to prevent chattering.

Please see Micrel's website at www.micrel.com for a complete selection of optical module ICs.

The following table summarizes the differences between devices in Micrel's latest family of Limiting Amplifiers.

Part Number	Integrated 50Ω Input Termination	LOS or SD	Active LOW or HIGH Enable
SY88773V	No	LOS	LOW
SY88823V	No	SD	HIGH
SY88843V	Yes	SD	HIGH
SY88973V	Yes	LOS	LOW

SY88823VEY[3]	K10-2	Industrial	823V with Pb-Free bar-line indicator	Pb-Free Matte-Sn
SY88823VEYTR[2, 3]	K10-2	Industrial	823V with Pb-Free bar-line indicator	Pb-Free Matte-Sn
SY88823VMG[3]	MLF-16	Industrial	823V with Pb-Free bar-line indicator	Pb-Free NiPdAu
SY88823VMGTR[2, 3]	MLF-16	Industrial	823V with Pb-Free bar-line indicator	Pb-Free NiPdAu

Notes:

1. Contact factory for die availability. Dice are guaranteed at T_A = 25°C, DC Electricals only.
2. Tape and Reel.
3. Pb-Free package is recommended for new designs.

PIN DESCRIPTION

Pin Number (MSOP)	Pin Number (MLF™)	Pin Name	Type	Pin Function
1	15	EN	TTL Input: Default is high.	Enable: De-asserts true data output when low. Incorporates 25kΩ pull-up to VCC.
2, 3	1, 4	DIN, /DIN	Differential Data Input	Differential Data Input. Input must be biased to meet common mode range.
4	6	REF		Reference Voltage: Bypass with 0.01µF low ESR capacitor from REF to VCC to stabilize SDLVL and REF.
5	14	SDLVL	Input: Default is maximum sensitivity.	Signal-Detect Level Set: A resistor from this pin to VCC sets the threshold for the data input amplitude at which the SD output will be asserted.
6 Exposed Pad	2, 3, 10, 11 Exposed Pad	GND	Ground	Device Ground. Exposed pad must be soldered (or equivalent) to the same potential as the ground pins.
7	7	SD	Open Collector TTL Output with internal 4.75kΩ pull-up resistor	Signal-Detect: asserts high when the data input amplitude rises above the threshold set by SDLVL.
8, 9	9, 12	DOUT, /DOUT	Differential CML Output	Differential Data Output.
10	5, 8, 13, 16	VCC	Power Supply	Positive Power Supply. Bypass with 0.1µF||0.01µF low ESR capacitors. 0.01µF capacitors should be as close as possible to VCC pins.

Absolute Maximum Ratings[1]

Supply Voltage (V_{CC}) ..... 0V to +7.0V
DIN, /DIN, EN, SDLVL Voltage ..... 0 to V_{CC}
REF Current ..... ±1mA
SD Current ..... ±5mA
DOUT, /DOUT Current ..... ±25mA
Storage Temperature (T_S) ..... –65°C to +150°C
Lead Temperature (Soldering, 20 sec.) ..... 260°C

Operating Ratings[2]

Supply Voltage (V_{CC}) ..... +3.0V to +3.6V or
..... +4.5V to +5.5V
Ambient Temperature (T_A) ..... –40°C to +85°C
Junction Temperature (T_J) ..... –40°C to +120°C
Package Thermal Resistance[3]
MLF™
θ_{JA} (Still-Air) ..... 61°C/W
Ψ_{JB} ..... 38°C/W
EPAD-MSOP
θ_{JA} (Still-Air) ..... 38°C/W
Ψ_{JB} ..... 22°C/W

DC ELECTRICAL CHARACTERISTICS

V_{CC} = 3.0V to 3.6V or 4.5V to 5.5V; R_{LOAD} = 50Ω to V_{CC}; T_A = –40°C to +85°C; typical values at V_{CC} = 3.3V, T_A = 25°C.

Symbol	Parameter	Condition	Min	Typ	Max	Units
I_{CC}	Power Supply Current	3.3V, **Note 4** 5V, **Note 4**		28 30	42 45	mA mA
	Power Supply Current	3.3V, **Note 5** 5V, **Note 5**		45 47	62 65	mA mA
V_{REF}	Reference Voltage			V_{CC}–1.3		V
V_{SDLVL}	SDLVL Voltage Range		V_{REF}		V_{CC}	V
V_{OH}	DOUT, /DOUT HIGH Voltage	**Note 6**	V_{CC}–0.020	V_{CC}–0.005	V_{CC}	V
V_{OL}	DOUT, /DOUT LOW Voltage	3.3V, **Note 6** 5V, **Note 6**	V_{CC}–0.475 V_{CC}–0.510	V_{CC}–0.400 V_{CC}–0.400	V_{CC}–0.350 V_{CC}–0.350	V V
V_{OFFSET}	Differential Output Offset	**Note 6**			±80	mV
Z_O	Single-Ended Output Impedance		40	50	60	Ω
V_{IHCMR}	Input Common Mode Range	**Note 7**	GND+2.15		V_{CC}	V

TTL DC ELECTRICAL CHARACTERISTICS

V_{CC} = 3.0V to 3.6V or 4.5V to 5.5V; T_A = –40°C to +85°C.

Symbol	Parameter	Condition	Min	Typ	Max	Units
V_{OH}	SD Output HIGH Level	Sourcing 100µA	2.4		V_{CC}	V
V_{OL}	SD Output LOW Level	Sinking 2mA			0.5	V
V_{IH}	EN Input HIGH Voltage		2.0			V
V_{IL}	EN Input LOW Voltage				0.8	V
I_{IH}	EN Input HIGH Current	V_{IN} = 2.7V V_{IN} = V_{CC}			20 100	µA µA
I_{IL}	EN Input LOW Current	V_{IN} = 0.5V	–0.3			mA

Notes:

1. Permanent device damage may occur if Absolute Maximum Ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to Absolute Maximum Ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance assumes the use of 4-layer PCB. Exposed pad must be soldered (or equivalent) to the device's most negative potential on the PCB.
4. Excludes current of CML output stage. See “Detailed Description.”
5. Total device current with no output load.
6. Output levels are based on a 50Ω to V_{CC} load impedance. If the load impedance is different, the output level will be changed. Amplifier is in a limiting mode.
7. The V_{IHCMR} range is referenced to the most positive side of the differential input signal.

AC ELECTRICAL CHARACTERISTICS

V_{CC} = 3.0V to 3.6V or 4.5V to 5.5V; T_A = –40°C to +85°C; R_{LOAD} = 50Ω to V_{CC}; typical values at V_{CC} = 3.3V, T_A = 25°C

Symbol	Parameter	Condition	Min	Typ	Max	Units
PSRR	Power Supply Rejection Ratio			35		dB
t_r, t_f	Output Rise/Fall Time (20% to 80%)	**Note 8**		60	120	ps
t_{JITTER}	Deterministic Random	**Note 9**		15 5		ps_{PP} ps_{RMS}
V_{ID}	Differential Input Voltage Swing		10		1800	mV_{PP}
V_{OD}	Differential Output Voltage Swing	3.3V, **Note 8** 5V, **Note 8**	700 700	800 800	950 1020	mV_{PP} mV_{PP}
HYS	SD Hysteresis	**Note 10**	2	4.6	8	dB
t_{OFF}	SD Release Time			0.1	0.5	µs
t_{ON}	SD Assert Time			0.2	0.5	µs
V_{SR}	SD Sensitivity Range	**Note 11**	10		35	mV_{PP}
$B_{–3dB}$	–3dB Bandwidth			2.0		GHz
$A_{V(Diff)}$	Differential Voltage Gain		32	38		dB
S_{21}	Single-Ended Small Signal-Gain		26	32		dB

Notes:

8. Amplifier in limiting mode. Input is a 200MHz square wave, t_r < 300ps.
9. Deterministic jitter measured using 2.488Gbps K28.5 pattern, V_{ID} = 10mV_{pp}. Random jitter measured using 2.488Gbps K28.7 pattern, V_{ID} = 10mV_{pp}.
10. Electrical signal.
11. This is the detectable range of input amplitudes that can de-assert SD. The input amplitude to assert SD is 2–8dB higher than the de-assert amplitude. See “Typical Operating Characteristics” for graphs showing how to choose a particular R_{SDLVL} or V_{SDLVL} for a particular SD de-assert, and its associated assert, amplitude. If increased SD sensitivity and hysteresis are required, an application note entitled “Notes on Sensitivity and Hysteresis in Micrel Post Amplifiers” is available at http://www.micrel.com/product-info/app_hints+notes.shtml.

TYPICAL OPERATING CHARACTERISTICS

V_{CC} = 3.3V, T_A = 25°C, R_{LOAD} = 50Ω to V_{CC}, unless otherwise stated.

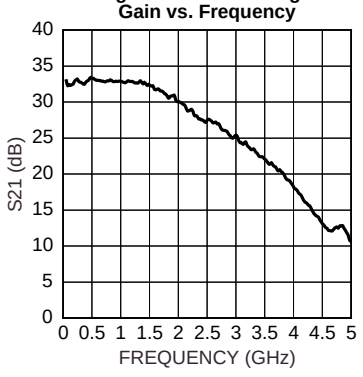
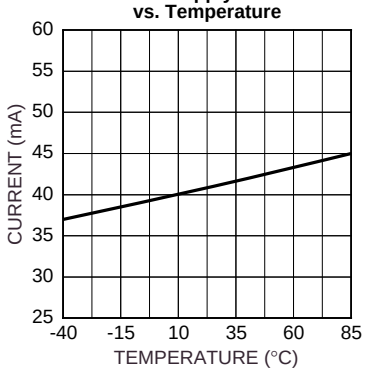
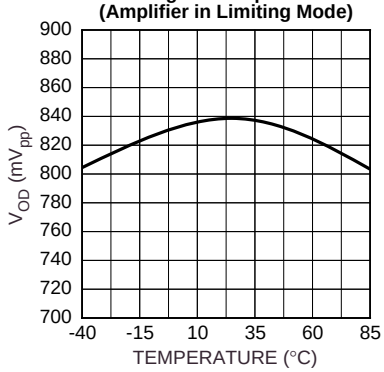
Single-Ended Small-Signal Gain vs. Frequency



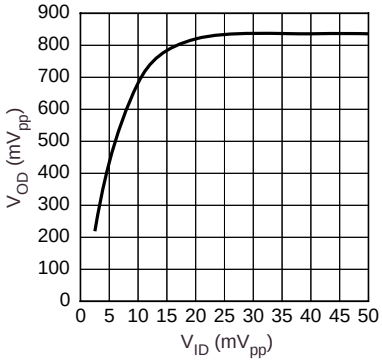
Power Supply Current vs. Temperature



Differential Output Voltage Swing vs. Temperature (Amplifier in Limiting Mode)



Differential Output Voltage Swing vs. Differential Input Voltage Swing



The SY88823V low-power, limiting post amplifier operate from a single +3.3V ±10% or +5V ±10% power supply, ov an industrial temperature range of –40°C to +85°C. Signa with data rates up to 3.2Gbps and as small as 10mV$_{PP}$ ca be amplified. Figure 1 shows the allowed input voltage swin The SY88823V generates an SD output, providing feedbac to EN for output stability. SDLVL sets the sensitivity of th input amplitude detection.

Input Amplifier/Buffer

The SY88823V's input is designed for V_{REF} as its nomin DC-bias point. If AC-coupling to the SY88823V, REF ca be used as the DC-bias point by externally connecting th inputs through appropriate termination resistors to REF. DC-coupling to the SY88823V, ensure the upstream device output swing meets the SY88823V's common-mode rang Figure 2 shows a simplified schematic of the input structur

The high sensitivity of the input amplifier detects an amplifies signals as small as 10mV$_{PP}$. The input amplifi allows input signals as large as 1800mV$_{PP}$. Input signa are linearly amplified with a typically 38dB differential voltage gain. Since it is a limiting amplifier, the SY88823V outputs typically 800mV$_{PP}$ voltage-limited waveforms for input signals that are greater than 10mV$_{PP}$. Applications requiring the SY88823V to operate with high gain should have the upstream TIA placed as close as possible to the SY88823V's input pins to ensure the device's best performance.

Output Buffer

The SY88823V's CML output buffer is designed to drive 50Ω lines. The output buffer requires appropriate termination for proper operation. An external 50Ω resistor to VCC or equivalent for each output pin provides this. Figure 3 shows a simplified schematic of the output structure and includes an appropriate termination method. Of course, driving a downstream device with a CML input that is internally terminated with 50Ω to VCC eliminates the need for external termination. As noted in the previous section, the amplifier outputs, typically 800mV$_{PP}$, waveforms across 25Ω total loads. The output buffer thus switches typically 16mA tail-current. Figure 4 shows the power supply current measurement which excludes the 16mA tail-current.

Signal Detect

The SY88823V incorporates a chatter-free, signal detect (SD) open-collector TTL output with internal 4.75kΩ pull-up resistor as shown in Figure 5. SD is used to determine that the input amplitude large enough to be considered a valid input. SD asserts high if the input amplitude rises above the threshold set by SDLVL and de-asserts low otherwise. SD can be fed back to the enable (EN) input to maintain output stability under a loss of signal condition. EN de-asserts low the true output signal without removing the input signals. Typically, 4.6dB SD hysteresis is provided to prevent chattering.

ignal Detect-Level Set

A programmable, signal-detect level set pin (SDLVL) sets e threshold of the input amplitude detection. Connecting n external resistor between VCC and SDLVL sets the oltage at SDLVL. This voltage ranges from V_{CC} to V_{REF}. he external resistor creates a voltage divider between VCC nd REF as shown in Figure 6. If desired, an appropriate xternal voltage may be applied rather than using a resistor. he relationship between V_{SDLVL} and R_{SDLVL} is given by:

$$V_{SDLVL} = V_{CC} - 1.3\frac{R_{SDLVL}}{R_{SDLVL} + 2.8}$$

here voltages are in volts and resistances are in kΩ.

The smaller the external resistor, which implies a smaller oltage difference from SDLVL to VCC, the lower the SD ensitivity. Hence, larger input amplitude is required to assert D. The "Typical Operating Characteristics" section contains raphs showing the relationship between the input amplitude etection sensitivity and V_{SDLVL} and R_{SDLVL}.

Hysteresis

The SY88823V provides typically 4.6dB SD electrical hysteresis. By definition, a power ratio measured in dB is 10log(power ratio). Power is calculated as V^2_{IN}/R for an electrical signal. Hence, the same ratio can be stated as 20log(voltage ratio). While in linear mode, the electrical voltage input changes linearly with the optical power and, hence, the ratios change linearly as well. Therefore, the optical hysteresis in dB is half the electrical hysteresis in dB given in the datasheet. The SY88823V provides typically 2.3dB SD optical hysteresis. As the SY88823V is an electrical device, this datasheet refers to hysteresis in electrical terms. With 4.6dB SD hysteresis, a voltage factor of 1.7 is required to assert SD.

Hysteresis and Sensitivity Improvement

If increased SD sensitivity and hysteresis are required, an application note entitled "Notes on Sensitivity and Hysteresis in Micrel Post Amplifiers" is available at http://www.micrel.com/product-info/app_hints+notes.shtml.
